SISBMUN III Committees

- UNSC
- IAEA
- UNHRC
- UNODC
- UNOOSA
- ISA
- Press Corps
- JMUN ECOSOC
- JMUN UNEP
- JMUN WHO

MUN Procedures

- Committee Session
    1) Roll Call
        - All countries called, delegate responds with “Present” or “Present and Voting”
    2) General Speaker’s List
        - Chosen delegates give opening speech
    3) Moderated Caucus
        - Speaking rules apply
    4) Unmoderated Caucus
        - Informal session, delegates can walk around and talk to other delegates
    5) Drafted Resolutions
        - Done with multiple delegates
    6) Voting
        - Delegates vote for best resolution

MUN Terminology

- Moderated Caucus
    - Short statements/comments from delegates on sub-issues
    - If someone wants to speak on the subject, they must raise their placard and wait for the chair to call on them
- Unmoderated Caucus
    - Free movement
    - Talk to other delegates
    - Form alliances
    - Brainstorm resolutions

- Floor
    - Opportunity to speak
- Motion
    - Suggest an action
        - Extend debate time
        - Vote on resolutions
- Second
    - Agree with another delegate's motion
- Objection
    - Disagree with another delegate's motion
- Abstain
    - If a delegate is unsure about their vote they can choose not to say yes or no definitively
        - Does not fully agree
        - Agrees enough not to vote against

MUN Points

- Question or suggestion made by a delegate to the chair
- Usually regarding their comfort
- Types of points :
    - Point of Order
        - Objection to a procedure
        - The chair has made a mistake
        - Parliamentary Procedures are not done correctly
        - Must be made
        - Must say point of order whilst raising their placard
        - May interrupt a speaker who has the floor

- Point of Inquiry
    - For clarification
- Point of Information
    - To add onto another speaker statement/resolution
    - To bring down the resolution
    - Must be formulated as a short question
    - May NOT interrupt speaker who has the floor
    - Must be directed to the chair, even though it is aimed at the speaker
    - Max 2 times
- Point of Personal Privilege
    - When a delegate feels uncomfortable
    - Room too hot / too cold
    - May interrupt speaker to request for change in atmosphere
- Point of Parliament Inquiry
    - Point of info directed at chair regarding the rules of procedure

UNOOSA Overview

- Committee Summary :
- Agenda :
    - Topic 1 - The Question of Preventing Anti-Satellite Weapon Tests by Major Powers
    - Topic 2 - The Question of Regulating Commercial Lunar and Asteroid Mining Missions
- Committee Allocations

Space History

Year	Individual/Company	Description	Nation
1543	Nicolaus Copernicus	→ The ultimate "paradigm shift" → The mathematical proposition of the **Heliocentric Model** (the Earth orbits the Sun)	Poland (□□)
1609	Johannes Kepler	→ 3 **laws of planetary motion** → Realized that planets do not orbit in perfect circles but rather in **ellipses**	Germany (□□)
1610	Galileo Galilei	→ Discovers the **Moons** of **Jupiter** (evidence that **not everything revolves around the Earth**) → **Phases of Venus** : provided the first **visual proof** that Venus orbits the Sun	Italy (□□)
1687	Sir Isaac Newton	→ Outlined the **laws of motion** → Outlines the **law of universal gravitation** → **Mathematical representation** of orbital movement → $\mathbf{F = G(m_1m_2)/r^2}$: remains the foundation of orbital mechanics	England (□□□□□□□)
1903	Konstantin Tsiolkovsky	→ Developed the "**Rocket Equation**" →**Theoretically** proved that **liquid-fueled rockets** were the only way of getting to space	Russia (□□)
1923	Hermann Oberth	→ **Author** of foundational **textbooks** on **human spaceflight**	Germany (□□)
1926	Robert Goddard	→ **World's first liquid-fueled rocket**	USA (□□)
1944	Wernher von Braun	→ Built the **first ever human-made object** to cross the **Kármán line** (**100km** altitude) – the **official boundary** of space → Built as a **weapon** for the Nazi Party	**Nazi** Germany (□□)
1957	OKB-1 / Sergei Korolev	→ First **Satellite** in Space (**Sputnik 1**)	Russia (□□)
1961	Yuri Gagarin	→ First **Human** in Space → via the **Vostok 1**	Russia (□□)
1965	Alexei Leonov	→ First **Space Walk** (about 12 mins) → via the **Voskhod 2** mission	Russia (□□)
1969	NASA	→ First **Moon Landing (**Apollo 11**)** → Neil Armstrong **&** Buzz Aldrin *"That's one small step for man, one giant leap for mankind" – Neil Armstrong*	USA (□□)

1971	Soyuz 11 Team / Georgiy Dobrovolsky, Vladislav Volkov, **&** Viktor Patsayev	→ First **Space Station** (Salyut 1) → World's first **orbital** space station → Only humans to die in space	Russia (□□)
1973	NASA	→ First **Human-Made Object** to Explore **Outer Planets** (Pioneer 10) → Followed by Voyager 1 & 2 – provided most detailed early study	USA (□□)
1975	□□Thomas Stafford, □□Vance Brand, □□Deke Slayton, □□Alexei Leonov, **&** □□Valery Kubasov	→ First **International Docking** (Apollo-Soyuz Test Project (ASTP)) → Established a precedent for **multinational space development** and **exploration** → Enabled potential **space rescues**	USA (□□) **&** Russia (□□)
1981	NASA	→ First **Space Shuttle** (Columbia) → First **reusable spacecraft** – changing how humans **access LEO** (low earth orbits)	USA (□□)
1990	NASA **&** ESA	→ The **Hubble Space Telescope** – launched into space → Provided **detailed images** of **outer space** allowing time estimates regarding the expansion of the universe	EU (□□) **&** USA (□□)
1998	CSA, ESA, JAXA, NASA, **&** Roscosmos	→ **ISS Assembly Begins** → The **first module** of the **International Space Station** is **launched** → The official beginning of <u>INTERNATIONAL</u> **space exploration** → Participating nations of the ISS (eg. Astronauts, Maintenance, Systems, etc.) : ● Canada (□□) ● Belgium (□□) ● Denmark (□□) ● France (□□) ● Germany (□□) ● Italy (□□) ● Netherlands (□□) ● Norway (□□) ● Spain (□□) ● Sweden (□□) ● Switzerland (□□) ● United Kingdom (□□) ● Japan (□□) ● Russia (□□) ● United States (□□)	Canada (□□), EU (□□), Japan (□□), USA (□□), **&** Russia (□□)
2004	CNSA **&** NASA	→ **Mars Rovers** → The start of decades of continuous (remote) surface exploration → Throughout Mars **rover missions**, astronauts have discovered - Evidence of **past liquid water**	China (□□) **&** USA (□□)

		- **Clay minerals** (friendly environment for life) - Evidence of potentially **habitable areas** (habitable conditions) - Ancient **microbial life** - **Climate activity** and changes → Notable Rovers : ● **Mars Exploration Rovers** (MER) ○ Spirit (MER-A) ○ Opportunity (MER-B) ● **Mars Science Laboratory** (MSL) ○ Curiosity ● **Tianwen-1** ○ Zhurong ● **Current / Most Advanced** ○ Perseverance	
2012	SpaceX	→ **SpaceX Dragon** → First **commercial** spacecraft to **deliver cargo** to the **ISS**	USA (□□)
2014	ESA	→ First **Comet Landing** → The first successful **landing** on a **comet** (Comet 67P) → via the **Rosetta** mission → A significant **milestone** in better **understanding** the **origins** of our solar system and the sources and methods of extraction of organic matter and natural resources	Austria (□□), Belgium (□□), Czech Republic (□□), Denmark (□□), Estonia (□□), Finland (□□), France (□□), Germany (□□), Greece (□□), Hungary (□□), Ireland (□□), Italy (□□), Luxembourg (□□), Netherlands (□□), Norway (□□), Poland (□□), Portugal (□□), Romania (□□), Slovenia (□□), Spain (□□), Sweden (□□), Switzerland (□□), **&** United Kingdom (□□)
2015	NASA		USA (□□)
2015	SpaceX		USA (□□)
2020	SpaceX		USA (□□)
2021			

2022			
2024			
(Upcoming) 2026			

Key Terms (Topic 1)

Term	*Category*	*Definition*
ASAT (Anti-Satellite Weapons)	**Technical & Environmental**	- Space weapons designed to incapacitate or destroy satellites for strategic or tactical purposes.
DA-ASAT (Direct-Ascent ASAT)	**Technical & Environmental**	- A missile launched from earth, designed to intercept and destroy a satellite in orbit - The most common type of kinetic test
Co-Orbital ASAT	**Technical & Environmental**	- A “killer satellite” that is placed into orbit, maneuvers close to a target, and then disables is via collision, explosives, or mechanical means
Kinetic ASAT	**Technical & Environmental**	- Physical destruction through impact - Creates long-lasting space debris
Non-Kinetic ASAT	**Technical & Environmental**	- Reversible or “soft” kills using lasers (dazzling), radio-frequency jamming, or cyber attacks
Kessler Syndrome	**Technical & Environmental**	- A theoretical “chain reaction” where debris from one collision creates more collisions, eventually making certain orbits (especially Low Earth Orbit - LEO) unusable for centuries
LEO (Low Earth Orbit)	**Technical & Environmental**	- The region from about 160 to 2,000 km above Earth, where satellites orbit quickly (around 90 mins per orbit) due to high speeds - Ideal for Earth observation, communication (like Starlink), and the International Space Station (ISS). - Offering lower latency and easier access, LEO satellites experience atmospheric drag - Faces increasing challenges from space debris.
Dual-Use Technology	**Technical & Environmental**	- Systems that have both civilian and military applications - Eg. a “servicing” satellite designed to refuel others (RPO - rendezvous and proximity operations) would technically be used as an ASAT
RPO (Rendezvous and Proximity Operations)	**Technical & Environmental**	- Orbital maneuvers bringing one spacecraft close to another - Essential for servicing, refueling, inspecting, debris removal, and assembly - Involving bringing them to the same orbit (rendezvous) and then maneuvering precisely near each other (proximity)
SSA/SDA (Space Situational Awareness/Domain Awareness)	**Technical & Environmental**	- The capability to track, identify, and predict the movement of objects in space - Essential for verifying that tests have occurred
PAROS (Prevention of an Arms Race in Outer Space)	**Legal & Diplomatic**	- The broad agenda at the UN (GA 1) focused on keeping space peaceful

UN Resolution 77/41 (2022)	**Legal & Diplomatic**	- A landmark resolution (led by the US) calling for a global moratorium on destructive DA-ASAT testing - The current primary "norm" being pushed by western nations
TCBMS (Transparency and Confidence-Building Measures)	**Legal & Diplomatic**	- Voluntary, non-binding actions (like pre-launch notifications) intended to reduce the risk of miscalculation or “accidental” space war
PPWT (Prevention of Placement of Weapons in Outer Space Treaty)	**Legal & Diplomatic**	- A draft treaty proposed by Russia and China - Focuses on banning “weapons in space” but is often criticized by the west for not addressing ground-based ASAT
OEWG (Open-Ended Working Group)	**Legal & Diplomatic**	- A UN-mandated body/group where nations meet to discuss “norms, rules, and principles of responsible behaviors”
LTS Guidelines (Long-Term Sustainability)	**Legal & Diplomatic**	- A set of 21 guidelines adopted by UNOOSA (COPUOS) to ensure space remains usable for future generations
“Sanctuary” Argument	**Strategic Concepts**	- The belief that space should be a “sanctuary” free of all weapons to protect global commerce
Space Deterrence	**Strategic Concepts**	- The idea that possessing ASAT capabilities prevents others from attacking your own satellites - Peace through Strength
Debris Moratorium	**Strategic Concepts**	- The commitment to only perform tests that do not create orbital debris (eg. non-kinetic tests)
“No First Placement”	**Strategic Concepts**	- A political pledge to not be the first to put a weapon in orbit - Typically supported by Russia and China
Verification	**Strategic Concepts**	- The “holy grail” of space law - The ability to prove that a satellite is or is not a weapon - Major powers often disagree on now this can be done without exposing secret tech

Opening Speech (Topic 1)

Honorable Chairs and Fellow Delegates, the delegate of Israel strongly condemns the weaponization of space. From Galileo's discoveries of planetary phases and natural satellites, to the development of anti-radiation vests for space use – humanity has made great strides in exploring and understanding the infinite potential of space. Israel believes that while space exploration poses exciting interplanetary prospects, the risks of irreversible consequences like Kessler Syndrome must be kept front of mind. In orbit, a single piece of debris merely one centimeter wide travels at speeds that give it the impact force of roughly 600,000 joules, with collisions capable of rendering space unusable for centuries. In order to preserve outer space and celestial bodies for international use, all members of UNOOSA must agree to bi-annually reviewed guidelines on the use of space – requiring calculated transparency of all space activities with clear, stated motives. Additionally to prevent weaponization attempts nations will face consequences determined by the UNSC via UNOOSA if the guidelines are not adhered to. However, Israel also recognizes that national sovereignty must remain a priority and encourages nations to navigate communication and transparency without compromising technological or intellectual property rights. Israel affirms that calculated transparency is required to ensure all relevant entities are informed through the disclosure of purpose, predicted results, and fail-safe plans of all space activities. The delegate of Israel remains committed to the peaceful use of space and prevention of weaponization. Israel is eager to work alongside the United States and other like-minded nations to develop more comprehensive criteria to protect our universe. This delegate yields the floor back to the chairs.

Topic : The Question of Preventing Anti-Satellite Weapon Tests by Major Powers

Delegation : Israel

Speech :

Opening Speech (Topic 2)

Honorable Chairs and Fellow Delegates, the delegate of Israel supports the extraction of resources from celestial bodies including by private and commercial entities. Israel believes that the extraction of natural resources from other planets and celestial bodies can be beneficial to mitigating costs of space travel and research by utilizing water ice as fuel alongside the use of other In-Situ Resources to enable the return trip, saving over 12 billion New Shekel or 4 billion USD per mission. By mitigating these costs, national space agencies and commercial entities can engage in further research and development and increasingly frequent trips all contributing to one of humanity's larger goals; to explore and one day even inhabit outer space. Despite the benefits of resource extraction from celestial bodies, the risks of physical repercussions and space debris as well as potential for national appropriation of territories intended for all of mankind are factors that must be considered to guide future resource extraction. Israel suggests all federal agencies and commercial entities provide an activity report to the UN, as supported by section 10 of the Artemis Accords. Furthermore, Israel urges all nations to compose national guidelines alongside Israel’s national legislation to define standards for developing planetary protection protocols to ensure celestial bodies are preserved for research purposes and with respect to the international use of space. The delegation of Israel is eager to continue to develop projects like the 10-Year Strategic Agreement that protects future generations of mankind and our universe while acknowledging the potential and multinational impact of space exploration and resource extraction. This delegate yields the floor back to the chairs.

Feedback on this Opening Speech for

Committee : UNOOSA

Topic : The Question of Regulating Commercial Lunar and Asteroid Mining Missions

Delegation : Israel

Speech :

Transparency Framework Development

Israel demands for the development of a report template for all space agencies to disclose mining missions given to UNOOSA. The mining report would indicate the source of extraction, the duration and date/s of extraction, purpose of extraction, volume of resources extracted, intended resources for extraction, and whether any resources are intended for laboratory research on Earth. Upon submission of this report, UNOOSA will convene to provide a multilateral consultation to support projects. Furthermore, Israel encourages UNOOSA members to limit their individual activities and engage in more multinational projects to ensure an ethical drive for equal distribution of resources extracted from celestial bodies. Israel also encourages further conversation regarding the distribution of resources and consideration of infrastructure needed to utilize such raw materials. In order to equally distribute space resources, this committee must first ensure all nations are equipped and informed on how to make use of given resources safely and for general benefit for all.

Position Paper

Israel - UNOOSA SISBMUN III Position Paper

Resolution Ideas

Topic 1

- Bi-annually reviewed guidelines on the use of space
    - Requiring peaceful (no international conflict) but supporting prospects of removing debris and unused satellites
    - Limits on duration of projects – requires UNOOSA consultation for continuation
    - Limits on (national) independent missions – no limits on international missions
- Major powers must receive either ¾ major power votes or 140 UNGA votes for weapon testing on (only) NATIONAL satellites and space stations
- Must NOT inhibit active satellite services (GPS, weather monitoring, etc.)
-

Topic 2

- Activity Report to UNOOSA
    - Date, location, duration, purpose, if used on earth, by whom?
    - Possible risks, fail-safe plans
    - Required for each mission by both commercial and national space agencies.
- Limits of ??? per mission
- Must not interfere with historical sites or other missions
- Mining location must be restored to the same standard as before the mining
- Must not appropriate territory
    - No use of national symbols on celestial bodies
    - Cannot reserve any area of space
    - Must remove all equipment from the celestial body upon completion of the mission or upon termination of the mission (whichever is first) unless given explicit documented permission from UNOOSA
    - Nations may not mine from the same place (within 10km radius) more than once every 3 years

Clause Ideas

Other Speeches

Removing Space Debris and Inactive Satellites Safely and with Due Regard

The delegation of Israel is committed to protecting space for current and future humanity however that cannot be guaranteed with the current state of objects in orbit. Israel believes that in order to ensure the sustainability of space exploration and technology for current and future generations, nations must collaborate to develop ethical and safe methods of removing space debris and inactive satellites which may include the use of ASAT testing in a broader sense of dissembling satellites and destroying the current space debris without producing further damages or risks to the orbit.

Developing Calculated Transparency Protocols

Protecting the intellectual and technical property of space activities whilst remaining transparent is one of the greatest challenges faced by space agencies across the globe. With endless layers of complexity, navigating all possible risks of information sharing feels impossible – however with calculated transparency protocols, the delegate of Israel believes that it is possible to avoid most risks of space destruction and weaponization through frequent UNOOSA consultations and the encouraging of multinational missions as opposed to individually motivated projects to ensure that the benefits of space are shared amongst nations. The delegate of Israel encourages members especially those with a lesser space presence to work together to develop innovative missions that enable progress that is ideal for all. For many members such as Israel and the USA, technical progressions remain highly confidential to protect national sovereignty as well as international services. Thus, Israel alongside the US, UK, France, Germany, and Canada suggests the development of a calculated transparency report template required for all space activity that informs all relevant bodies on the events and risks without exposing federal secrets or risking appropriation.

The Delicacy of Aliens

The delegate of Israel
